

2024 BMED223 :: Hands-on instructions

- **Filename:** week13_studentID_studentName.py
- **Deadline:** 2024/06/03 23:59
- **No excuse for late submission.** Prepare for submission in advance.
- There is no limit on the number of submissions, but grading will be based on the final file.
- Use comments (#, #%%, etc.) to separate problems.

서동휘 andy1200@korea.ac.kr

박영주 lime2514@korea.ac.kr

[Problem 1]

1. Load the data

- A. The data *passenger.csv* includes passenger data related to ship sinking accidents. The data structure is as shown in the table below.

Columns	Descriptions	Values
PassengerId	Passenger ID	
Survived	Survival	0 = No, 1 = Yes
Pclass	Ticket class	1 = 1 st , 2 = 2 nd , 3 = 3 rd
Gender	Biological sex	
Age	Age in years	
SibSp	# of siblings / spouses aboard the ship	
Parch	# of parents / children aboard the ship	
embarked	Port of Embarkation	C = Cherbourg, Q = Queenstown, S = Southampton

- B. Load *passenger.csv* into a Pandas dataframe.
- C. Print information about the dataframe.
- D. Print the top 10 rows of the dataframe.
- E. Print all columns and index of the dataframe.

2. Data manipulation

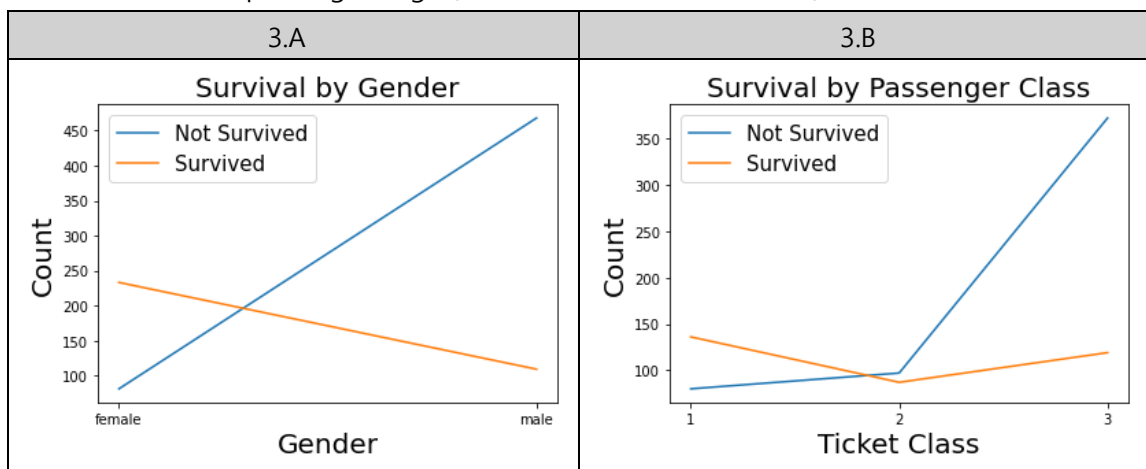

- A. Remove the columns '*SibSp*' and '*Parch*' from the dataframe.
- B. Extract the rows where '*Gender*' is female from the dataframe.
- C. Extract the rows with surviving women from the result of 2.B.
- D. Calculate the ratio of passengers survived among female passengers and print the result in the form below.

```
>> {:.2f} of the women survived.
```

- E. In the same way, calculate and print the ratio of non-surviving male passengers.
`>> {:.2f} of the men could not survive.`
- F. Divide the dataframe into three separate dataframes, **p1**, **p2**, and **p3**, based on the value of the 'pclass' column (without memory sharing).
- G. Sort the dataframes **p1**, **p2**, and **p3** by 'Age' column in ascending order.
- H. Calculate the mean and standard deviation of 'Age' for each dataframe (**p1**, **p2**, and **p3**), and print them in the following format to express those values to the second decimal place.
`>> Average age of grade 1: {:.2f} +/- {:.2f}.`
`>> Average age of grade 2: {:.2f} +/- {:.2f}.`
`>> Average age of grade 3: {:.2f} +/- {:.2f}.`
- I. Extract the column 'Age' and 'Embarked' from **p1**, **p2** and **p3**, combine them into one dataframe.
- J. If the column 'Age' contains no value (NaN), remove the row.

3. Data visualization

- A. Plot the gender distribution according to survival status (Survival count vs. Gender)
- B. Plot survival depending on age (Survival count vs. Ticket class)

4. Data storage

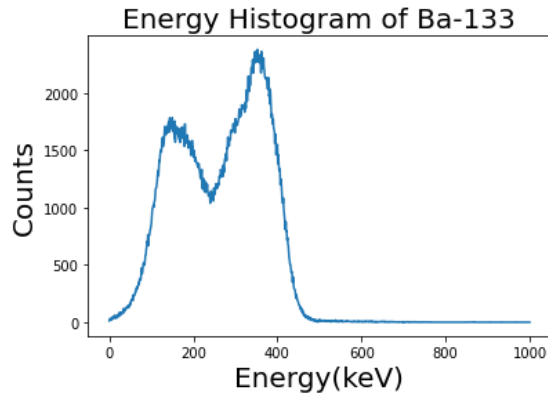

- A. Save the result of 2.J as an Excel file (**result.xlsx**).

Example for result.xlsx			
	Age	Embarked	
0	38	C	
1	35	S	
2	54	S	
3	58	S	
4	28	S	
5	19	S	
...			

[Problem 2]

Write the program to draw the energy spectrum from **'Ba133_for_Ehisto.csv'** by following the step below. The csv file contains total 555,170 rows. All data are in units of eV.

1. Read the CSV file into the dataframe **'df'**.
2. Add a column **'E'** to **df** for energy of photons (rows).
Calculate the energy (E) for each row using the equation below. E is in units of eV. (1 MeV = 1,000 keV = 1,000,000 eV)
$$E = a(X_+ + X_- + Y_+ + Y_-) + b$$
where $a = 7.42344$ and $b = -147632.12$
3. Select the rows that contain the energy between 0 and 1 **MeV**. Then associate it into a dataframe **'df2'**.
4. Generate the energy histogram (frequency vs energy) from the column **'E'** and convert it a dataseries **'ehist'**. Set the index as the energy in **keV**.
5. Plot the histogram **'ehist'** as shown below.

'Ba133_for_Ehisto.csv'	2.(2)

The x-axis represents Energy (keV) from 0 to 1000, and the y-axis represents Counts from 0 to 2000. The spectrum shows two distinct peaks: a smaller one around 180 keV and a larger, sharper one around 350 keV.</p>
